product information

Headshells

schick Liebenthal offers 4 different headshells.

They all feature the same shape with the highest dimensional stability. But the materials are different and also the overall weight. All four allow azimuth adjustment.

Material	Weight in grams
Bubinga wood	10,8
Black Plinth material	15
Grey Plinth material with metal flakes	15,4
Damped Graphite	16,8

The 4 different materials allow to use a very wide range of cartridges on the schick tonearms. With the light wood version it is possible to use cartridges with a softer compliance. The heavier ones are ideally combined with with harder compliant cartridges. But also the material properties give a different sound.

schick Liebenthal headshells are equipped with a very high quality connector. These offer a large mounting collar, evenly plated surface, very good isolation material, rounded contact pins with best contact properties. All these features are lacking in the widely used Chinese version of this connector.
